Exercise E1 Conversions: Battery

2. How many minutes could a constant power of $1~{\rm W}$ be supplied by an ideal battery with $10~{\rm kWh}$?

1. How many hours could a constant power of $1~{\rm W}$ be supplied by an ideal battery with $10~{\rm kWh}$?

Result

Solution

$$\begin{align*} t = 200'000~{\rm min} \end{align*}$$

There are additional losses:

$$\begin{align*} W &= 10~{\rm kWh} &&= 10'000~{\rm Wh}\\ \\ t &= {{W }\over{P }} &&= {{10'000~{\rm Wh}}\over{3~{\rm W}}} &&= 3'333~{\rm h} = 200'000~{\rm min} \quad (= 139~{\rm days}) \end{align*}$$

- The battery has an internal resistance. Depending on the current the battery provides, this leads to internal losses.
- The internal resistance of the battery depends on the state of charge (SoC) of the battery.
- The wires also add additional losses to the system.
