resonant circuit, exam ee2 SS2022

Exercise E13 Series Resonant Circuit
(written test, approx. 10 % of a 120-minute written test, SS2022)

2. What is the resonance frequency of the series RLC circuit shown in the circuit diagram? The resistance of an inductor is $R = 10 \text{ } \Omega$ and the inductance is $L = 60 \text{ } \mu\text{H}$.

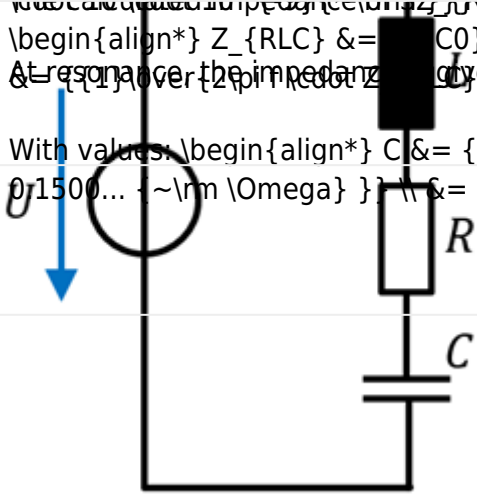

A capacitor, shall be given with the following value $C = 10 \text{ nF}$. Which value would f_0 have for the given f_0 ?

- Path: $C = 10 \text{ nF}$
- $R = 10 \text{ } \Omega$
 - $Z_{RLC} = 250.5 \text{ } \Omega$
 - $L = 60 \text{ } \mu\text{H}$
 - $f_0 = 10 \text{ MHz}$

The resonance frequency is given as $f_0 = \frac{1}{2\pi\sqrt{LC}}$ $\Rightarrow f_0 = \frac{1}{2\pi\sqrt{60 \cdot 10^{-12} \cdot 10^{-8}}}$
 That is, the resonance frequency of the RLC circuit is $f_0 = 250.5 \text{ MHz}$ (approx.)

$Z_{RLC} = R + j\omega L - \frac{j}{\omega C} \Rightarrow Z_{RLC} = R + j(\omega L - \frac{1}{\omega C})$
 At resonance, the impedance is purely real.

With values: $C = 10 \text{ nF} = 10 \cdot 10^{-9} \text{ F}$
 $f_0 = 10 \text{ MHz} = 10 \cdot 10^6 \text{ Hz}$

1. What is the impedance Z_{RLC} of this real capacitor for $f_0 = 100 \text{ MHz}$? (Phase and magnitude)

Path

The impedance Z_{RLC} is given by: $Z_{RLC} = R + j\omega L - \frac{j}{\omega C}$
 $Z_{RLC} = R + j(\omega L - \frac{1}{\omega C})$

Putting in the numbers, only for the reactive part X_{LC} : $X_{LC} = 2\pi \cdot 100 \cdot 10^6 \cdot 60 \cdot 10^{-12} - \frac{1}{2\pi \cdot 100 \cdot 10^6 \cdot 10 \cdot 10^{-9}}$
 $X_{LC} = -121.45 \text{ m}\Omega$

With the real and imaginary parts, we can derive the magnitude and phase:

$$Z_{RLC} = \sqrt{R^2 + X_{LC}^2} = \sqrt{(88 \text{ m}\Omega)^2 + (-121.45 \text{ m}\Omega)^2} = 150.0... \text{ m}\Omega$$

$$\varphi = \arctan\left(\frac{X_{LC}}{R}\right) = \arctan\left(\frac{-121.45 \text{ m}\Omega}{88 \text{ m}\Omega}\right) = -0.9437... = -54.07...^\circ$$
