resistivity, power, exam ee1 SS2023

**Exercise E1 Equivalent linear Source
(written test, approx. 7 % of a 60-minute written test, SS2023)**

The conductivity of a dielectric material is given by $\rho = \rho_0 e^{\alpha T + \beta T^2}$ where $\rho_0 = 10^{17} \Omega^{-1} m^{-1}$ at $T = 20^\circ C$. The material is used as a dielectric in a capacitor with two parallel plates of area $A = 100 \text{ cm}^2$ and thickness $d = 1 \text{ mm}$. The plates are connected to a DC voltage source of $V = 100 \text{ V}$. Calculate the resistance of the capacitor at $T = 20^\circ C$ and $T = 55^\circ C$.

Solution

The resistivity of the dielectric material is $\rho(T) = 10^{17} e^{\alpha T + \beta T^2} \Omega m$.

For the given material the temperature coefficients in the range of $20^\circ C$ and $55^\circ C$ are given as $\alpha = -0.048 \text{ 1/K}$ and $\beta = +0.00057 \text{ 1/K}^2$.

$$R(T) = R(20^\circ C) \cdot (1 + \alpha \Delta T + \beta \Delta T^2 + \dots)$$

$$R(55^\circ C) = 80 \text{ G}\Omega \cdot (1 - 0.048 \text{ 1/K} \cdot (35 \text{ K}) + 0.00057 \text{ 1/K}^2 \cdot (35 \text{ K})^2)$$

Calculate the resistance for the dielectric material for $20^\circ C$.

Solution

```
\begin{align*} R(20 \sim \text{r m } ^\circ\text{C}) \&= \rho \cdot \left\{ \frac{d}{A} \right\} \&= 10^{\{17\}} \sim \Omega \\ \text{r m m} \cdot \left\{ \left\{ 0.8 \cdot 10^{\{-6\}} \sim \text{r m m} \right\} \over \left\{ 1 \sim \text{r m m}^2 \right\} \right\} \end{align*}
```
