### Exercise E1 Capacitor

(written test, approx. 12 % of a 120-minute written test, SS2024)

2. With the graph of the magnitude of the electric field strength  $E$  of a parallel plate capacitor, the diagram shows the cross-section of the capacitor. The inner conductor has a diameter of  $0.6 \text{ mm}$  and the outer conductor has a diameter of  $1.0 \text{ mm}$ . The inner conductor is connected to the positive terminal of a DC voltage source and the outer conductor is connected to the negative terminal. The diagram shows the cross-section of the capacitor with the inner conductor on the left and the outer conductor on the right. The inner conductor has a diameter of  $0.6 \text{ mm}$  and the outer conductor has a diameter of  $1.0 \text{ mm}$ . The inner conductor is connected to the positive terminal of a DC voltage source and the outer conductor is connected to the negative terminal. The diagram shows the cross-section of the capacitor with the inner conductor on the left and the outer conductor on the right. The inner conductor has a diameter of  $0.6 \text{ mm}$  and the outer conductor has a diameter of  $1.0 \text{ mm}$ . The inner conductor is connected to the positive terminal of a DC voltage source and the outer conductor is connected to the negative terminal.

Path

- Inner conductor:  $+3.3 \text{ mA}$ ,  $+10 \text{ nC}$  (current into the plane of the diagram)
- for  $(0.1 \text{ mm} | 0)$ :  $E_{\text{in}} = 5.28 \text{ V/m}$
- Outer conductor:  $-3.3 \text{ mA}$ ,  $0 \text{ nC}$  (current out of the plane of diagram)
- for  $(0.55 \text{ mm} | 0)$ :  $E_{\text{out}} = 6.985 \text{ V/m}$

The magnitude of the electric displacement field  $D$  can be calculated by:  $\int D \cdot dA = Q_{\text{enc}}$ .

Here, for any position  $r$  from the center, the surrounding area is the surface of a cylindrical shape (here for simplicity without the round endings).

For  $r < 0.1 \text{ mm}$ , the surface of the cylinder is  $A = 2\pi r \cdot l$ . This leads to:  $D(r) = \frac{Q_{\text{enc}}}{A} = \frac{Q_{\text{enc}}}{2\pi r \cdot l}$ . This is proportional to the area within this radius. Therefore, the formula  $H = \frac{I_{\text{enc}}}{2\pi r}$  gets  $H(r) = \frac{I_{\text{enc}}}{2\pi r}$  at  $r = 0.1 \text{ mm}$  and  $H(r) = \frac{I_{\text{enc}}}{2\pi r}$  at  $r = 0.55 \text{ mm}$ . This leads to a formula proportional to  $r$ .

For  $r > 0.55 \text{ mm}$  one also gets a linear proportionality with a different approach:  $D(r) = \frac{Q_{\text{enc}}}{2\pi r \cdot l} = \frac{10 \cdot 10^{-9} \text{ C}}{2\pi \cdot 0.1 \cdot 10^{-3} \text{ m} \cdot 0.5 \cdot 10^{-3} \text{ m}}$  and  $D(r) = \frac{Q_{\text{enc}}}{2\pi r \cdot l} = \frac{10 \cdot 10^{-9} \text{ C}}{2\pi \cdot 0.55 \cdot 10^{-3} \text{ m} \cdot 0.5 \cdot 10^{-3} \text{ m}}$

Hint: For the direction, one has to consider the sign of the enclosed charge. By this, we see that the  $D$ -field is positive. But here, again only the magnitude was questioned!

.. What is the magnitude of the magnetic field strength  $H$  at  $(0.1 \text{ mm} | 0)$  and  $(0.55 \text{ mm} | 0)$ ?

Path

The magnitude of the magnetic field strength  $H$  can be calculated by:  $H = \frac{I}{2 \pi \cdot r}$

So, we get for  $H_{\text{i}}$  at  $(0.1 \text{ mm} \mid 0)$ , and  $H_{\text{o}}$  at  $(0.55 \text{ mm} \mid 0)$ :

$$\begin{aligned} H_{\text{i}} &= \frac{I}{2 \pi \cdot r_{\text{i}}} \quad \&= \frac{+3.3 \text{ A}}{2 \pi \cdot \{0.1 \cdot 10^{-3} \text{ m}\}} \quad \& H_{\text{o}} &= \frac{I}{2 \pi \cdot r_{\text{o}}} \\ & &= \frac{+3.3 \text{ A}}{2 \pi \cdot \{0.55 \cdot 10^{-3} \text{ m}\}} \quad \end{aligned}$$

Hint: For the direction, one has to consider the right-hand rule. By this, we see that the  $H$ -field on the right side points downwards.

Therefore, the sign of the  $H$ -field is negative.

But here, only the magnitude was questioned!
