Exercise E1.1 Impedances at different Frequencies
(written test, approx. 18 % of a 60-minute written test, WS2022)

Exercise E1.1: A series circuit contains a resistor $R_1 = 1.00 \text{ } \Omega$ and a capacitor $C_1 = 40 \text{ nF}$. A voltage source $v(t) = 4.7 \cos(2\pi \cdot 450 \text{ kHz} \cdot t)$ is connected in series with the components. Determine the absolute value of the impedance of the series circuit at $f = 4 \text{ MHz}$.

Solution

$$R_1 = 1.00 \text{ } \Omega$$

$$R_2 = 10.0 \text{ } \Omega$$

A series circuit means that the current is constant on every component.

The equivalent impedance for R and L combined is given by

Parallel circuit means that the voltage is the same on R_1 and C_1

Since R_1 and C_1 are in parallel, the total impedance Z_{RC} is perpendicular to R_2 . This can be simplified to $Z_{RC} = \frac{R_1 \cdot X_C}{R_1 + X_C}$

Z_{RC} is perpendicular to R_2 (It has to, since R_1 is perpendicular to X_C)

Therefore, the resulting current of the parallel circuit is given as:

$$I_{RC} = \frac{V}{\sqrt{R_2^2 + \left(\frac{R_1 \cdot X_C}{R_1 + X_C}\right)^2}}$$

Back to the first formula:

$$R_3 \cdot I_{RC} = X_C \cdot I_{RC} \cdot \frac{R_1 + X_C}{R_1 + X_C} = \frac{X_C \cdot (R_1 + X_C)}{\sqrt{R_2^2 + \left(\frac{R_1 \cdot X_C}{R_1 + X_C}\right)^2}}$$
