complex impedance, exam ee1 WS2022

Exercise E1 Impedances at different Frequencies (written test, approx. 18 % of a 60-minute written test, WS2022)

Exercise E1: A series circuit consists of a resistor \$R_1\$ with \$R_1 = 1.00 \text{ }\Omega\$, a capacitor \$C_1\$ with \$C_1 = 40 \text{ nF}\$, and an AC voltage source \$U_1\$ with \$U_1 = 10 \text{ V}\$ and \$f = 4 \text{ MHz}\$. The current \$I\$ through the circuit is \$I = 10 \text{ mA}\$. Calculate the absolute value of the impedance \$|Z|\$ of the circuit.

Solution

$$R_1 = 1.00 \text{ }\Omega$$

$$R_2 = 10.0 \text{ }\Omega$$

A series circuit means that the current is constant on every component.

The equivalent impedance for \$R\$ and \$L\$ combined is given by

Parallel circuit means that the voltage is the same on \$R_1\$ and \$C_1\$

Since \$R_1\$ and \$C_1\$ are in parallel, the total impedance \$Z_{parallel}\$ is given by

$$\frac{1}{Z_{parallel}} = \frac{1}{R_1} + \frac{1}{jX_{C1}}$$

Since \$X_{C1} = \frac{1}{\omega C_1}\$, we can simplify to

$$Z_{parallel} = \frac{R_1 \cdot jX_{C1}}{R_1 + jX_{C1}}$$

\$Z_{parallel}\$ is perpendicular to \$R_2\$ (It has to, since \$R_1\$ is perpendicular to \$jX_{C1}\$)

Therefore, the resulting current of the parallel circuit is given as:

$$I_{parallel} = \sqrt{I_{R1}^2 + I_{C1}^2}$$

This can be rearranged to get \$R_2\$

$$R_2 = \frac{U_1}{I_{parallel}} = \frac{U_1}{\sqrt{I_{R1}^2 + I_{C1}^2}}$$

Back to the first formula:

$$R_3 \cdot I_{R3} = X_{C3} \cdot I_{C3}$$

$$R_3 = \frac{X_{C3} \cdot I_{C3}}{I_{R3}} = \frac{1}{\omega C_3} \cdot \frac{I_{C3}}{I_{R3}}$$
