Exercise E1.1 Resistance of a Wire by Resistivity (written test, approx. 6 % of a 60-minute written test, WS2022)

A heating element made of Nichrome wire with a temperature coefficient of resistance of $1.80 \times 10^{-5} \text{ } ^\circ\text{C}^{-1}$ is used. Electric power dissipation (= heat flow) of $P=40 \text{ W}$ is necessary. Calculate the current I and the temperature T for heating elements.

The Nichrome wire has a resistivity of $1.10 \times 10^{-6} \text{ } \Omega \text{ m}$.

The heating element is 3 m long and has a diameter of 3.57 mm .

Solution:
$$R = \rho \cdot \frac{l}{A} = 1.10 \times 10^{-6} \cdot \frac{3}{\pi \cdot (1.785 \times 10^{-3})^2} = 0.33 \text{ } \Omega$$

1. Calculate the resistance R of the heating element.

Solution:
$$P = U \cdot I = R \cdot I^2 \quad \rightarrow \quad I = \sqrt{\frac{P}{R}} = \sqrt{\frac{40 \text{ W}}{0.33 \text{ } \Omega}} = 11.0 \text{ A}$$

$$R = \rho \cdot \frac{l}{A} \quad | \quad \text{with } A = r^2 \cdot \pi = \frac{1}{4} d^2 \cdot \pi \quad | \quad R = \rho \cdot \frac{4 \cdot l}{d^2 \cdot \pi} \quad | \quad R = 1.10 \times 10^{-6} \text{ } \Omega \text{ m} \cdot \frac{4 \cdot 3 \text{ m}}{(3.57 \times 10^{-3} \text{ m})^2 \cdot \pi} = 0.33 \text{ } \Omega$$
