Exercise E7 Cylindrical Coil
(written test, approx. 6 % of a 120-minute written test, SS2021)

A) The magnetic flux (2 points) information is given:

Result

- Length $l = 30 \text{ cm}$,

Path Winding diameter $d = 390 \text{ mm}$,

- Number of windings $N = 240$,
- Current in the conductor $I = 500 \text{ mA}$,
- Material inside: Air

$\mu_0 = 4\pi \cdot 10^{-7} \text{ Vs/Am}$

The magnetic field strength $B = \mu_0 \mu_r H$:

The proportion of the magnetic voltage outside the coil can be neglected. Determine the following for the inside of the coil:

a) the magnetic field strength (2 points)

Putting in the numbers: $B = \mu_0 \cdot N \cdot I / l = 4\pi \cdot 10^{-7} \cdot 240 \cdot 0.5 / 0.3 = 0.0005026... \text{ Vs/m}^2$

path

Therefore: $\Phi = B \cdot \pi \cdot (d/2)^2$

Putting in the numbers: $\Phi = 0.0005026... \text{ Vs/m}^2 \cdot \pi \cdot (0.39 \text{ m} / 2)^2 = 0.00006004... \text{ Vs}$

Putting in the numbers: $H = \{240 \cdot 0.5 \text{ A}\} / 0.3 \text{ m}$
