Exercise E19 Charges in Electroplating

To get a different metal coating onto a surface, often 🔗Electroplating is used. In this process,
the surface is located in a liquid, which contains metal ions of the coating.
In the following, a copper coating (e.g. for corrosion resistance) shall be looked on. The
charge of one copper ion is around $1.6022 \cdot 10^{-19}~{\rm C}$, what is the charge on
the surface if there are $8 \cdot 10^{22}~{\rm ions}$ added?

Result

$$\begin{align*} 12'818~{\rm C} \end{align*}$$

Solution

$$\begin{align*} 8 * 10^{22} \cdot 1.6022 *10^{-19}~{\rm C} = 12'817.6~{\rm C} \end{align*}$$
