# Exam Winter Semester 2022

## Additional permitted Aids

- non-programmable calculator,
- formulary (2 DIN A4 pages)

## Hits

- The duration of the exam is 60 min.
- Attempts to cheat will lead to exclusion and failure of the exam.
- Withdrawal is no longer possible after these exam has been handed out.
- Please write down intermediate calculations and results on the assignment sheet. (when more space is needed also on the reverse side. In this case: Mark it clearly).
- Always use units in the calculation.
- Use a document-proof, non-red pen.

## Only EEE1-relevant Part

**This part is only for about 25 minutes !**

### Exercise E1 Resistance of a Wire by Resistivity

(written test, approx. 6 % of a 60-minute written test, WS2022)

2. Heating elements are used to heat wires with a temperature of  $180^\circ\text{C}$ . An electric power dissipation (= heat flow) of  $P=40\text{ W}$  is necessary.

Determine the current  $I$  needed to operate it.

The Nichrome wire has a resistivity of  $1.10 \cdot 10^{-6}\ \Omega\text{m}$ .

The heating element is  $3\text{ m}$  long and has a diameter of  $3.57\text{ mm}$ .

∴ Calculate the resistance  $R$  of the heating element.

Solution

$$\begin{aligned} P &= U \cdot I = R \cdot I^2 \quad \rightarrow \quad I = \\ &= \sqrt{\frac{P}{R}} = \sqrt{\frac{40\text{ W}}{0.33\ \Omega}} \end{aligned}$$

$$\begin{aligned} R &= \rho \cdot \frac{l}{A} \quad \text{with } A = r^2 \cdot \pi = \\ &= \frac{1}{4} d^2 \cdot \pi \quad \text{and } R = \rho \cdot \frac{4 \cdot l}{d^2 \cdot \pi} \quad \text{and } R = \\ &= 1.10 \cdot 10^{-6}\ \Omega\text{m} \cdot \frac{4 \cdot 3\text{ m}}{(3.57 \cdot 10^{-3}\text{ m})^2 \cdot \pi} \end{aligned}$$

**Exercise E3 Temperature-dependent Resistance**  
**(written test, approx. 6 % of a 60-minute written test, WS2022)**

2. The diagram explains why the effect of constant resistance on refrigeration system. The circuit has a resistor of  $10 \text{ k}\Omega$  at  $25^\circ\text{C}$ . Your answer.

Its temperature coefficients are:  $\alpha = 0.01 \cdot 10^{-6} \text{ K}^{-1}$  and  $\beta = 71 \cdot 10^{-6} \text{ K}^{-2}$

Result: The temperature inside the refrigeration system can reach down to  $-40^\circ\text{C}$ .

Calculate the resistance of the thermistor at  $-40^\circ\text{C}$ .

The power transfered to the load of the circuit and of the heat. Therefore, a solution is to increase the resistance of the thermistor.

Therefore, with constant  $U$  and increasing  $R$  the power decreases. Ten times more resistance decreases the heat flow to one-tenth.

$$R = R_0 \cdot (1 + \alpha \cdot \Delta T + \beta \cdot \Delta T^2)$$

with  $\Delta T = T_{\text{end}} - T_{\text{start}}$

$$R = 10 \text{ k}\Omega \cdot (1 + 0.01 \cdot 10^{-6} \cdot (-40 - 25) + 71 \cdot 10^{-6} \cdot (-40 - 25)^2)$$

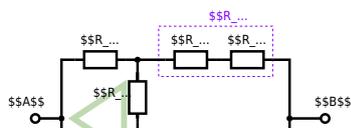

**Exercise E1 Pure Resistor Network Simplification**  
**(written test, approx. 13 % of a 60-minute written test, WS2022)**

The following shall be used:  $R_1 = 20 \text{ k}\Omega$ ,  $R_2 = 10 \text{ k}\Omega$ ,  $R_3 = 15 \text{ k}\Omega$  and the voltage  $U = 10 \text{ V}$ .  
 Result:  $R_{\text{eq}} = 132.8 \text{ }\Omega$ .

Solution

$$R_{\text{eq}} = 132.8 \text{ }\Omega$$

Now a wye-delta transformation is necessary.

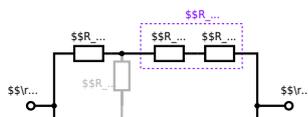

Since  $R_2=R_3$  and based on the equations for the transformation, the transformed  $R_Y$  is given as: 
$$R_Y = \frac{R_2 \cdot R_2}{R_2 + R_2 + R_2} = \frac{(100 \sim \Omega)^2}{3 \cdot 100 \sim \Omega} = \frac{1}{3} \cdot 100 \sim \Omega = 33.33 \sim \Omega$$

The equivalent resistor is given by a parallel configuration of resistors in series: 
$$R_{\text{eq}} = R_Y + (R_Y + R_1 + R_1) \parallel (R_Y + R_2) \parallel R_{\text{eq}} = 33.33 \sim \Omega + (33.33 \sim \Omega + 400 \sim \Omega) \parallel (33.33 \sim \Omega + 100 \sim \Omega) \parallel$$

1. The switch shall now be open. Calculate the equivalent resistance  $R_{\text{eq}}$  between  $A$  and  $B$ .

Solution

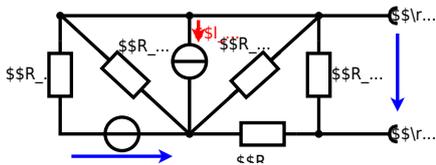

The equivalent resistor is given by a parallel configuration of resistors in series:

$$R_{\text{eq}} = (R_2 + R_1 + R_{-1}) \parallel (R_2 + R_2) \parallel R_{\text{eq}} = (100 \Omega + 200 \Omega + 200 \Omega) \parallel (100 \Omega + 100 \Omega) \parallel R_{\text{eq}} = \{500 \Omega \cdot 200 \Omega\} \over {500 \Omega + 200 \Omega} \parallel$$

**Exercise E2 Equivalent linear Source  
(written test, approx. 14 % of a 60-minute written test, WS2022)**

The circuit in the following has to be simplified.  
Result

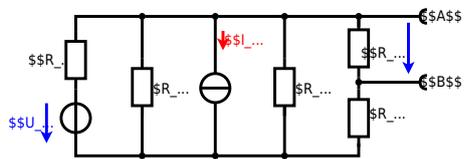

$$U_{\text{s}} = U_{\text{AB}} = 4.5 \text{ V} \quad R_{\text{i}} = R_{\text{AB}} = 6 \Omega$$

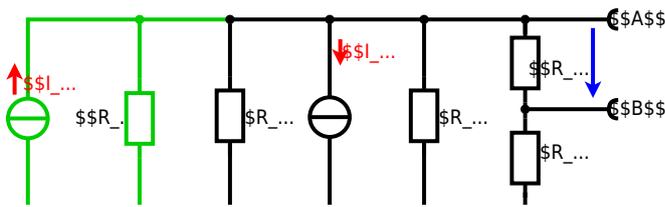

Calculate the internal resistance  $R_i$  and the source voltage  $U_s$  of an equivalent linear voltage source on the connectors  $A$  and  $B$ .  $R_1=5.0 \Omega$ ,  $U_2=6.0 \text{ V}$ ,  $R_3=10 \Omega$ ,  $I_4=4.2 \text{ A}$ ,  $R_5=10 \Omega$ ,  $R_6=7.5 \Omega$ ,  $R_7=15 \Omega$ . Use equivalent sources in order to simplify the circuit!

Solution

The best thing is to re-think the wiring like rubber bands and adjust them:

The linear voltage source of  $U_2$  and  $R_1$  can be transformed into a current source  $I_2 = \frac{U_2}{R_1}$  and  $R_1$ :

Now a lot of them can be combined. The resistors  $R_1$ ,  $R_3$ ,  $R_5$  are in parallel, like also  $I_2$  and  $I_4$ : 
$$R_{135} = R_1 || R_3 || R_5$$
 
$$I_{24} = I_2 - I_4$$
 The resulting circuit can again be transformed:

Here, the  $U_{24}$  is calculated by  $I_{24}$  as the following: 
$$U_{24} = I_{24} \cdot R_{135} + I_{24} \cdot R_2 + I_{24} \cdot R_3$$

$$U_{24} = U_{24} \cdot \left( \frac{U_2}{R_1} - I_4 \right) \cdot R_1 \parallel R_3 \parallel R_5$$

On the right side of the last circuit, there is a voltage divider given by  $R_{135}$ ,  $R_6$ , and  $R_7$ .

Therefore the voltage between  $A$  and  $B$  is given as:

$$U_{AB} = U_{24} \cdot \frac{R_7}{R_6 + R_7 + R_1 \parallel R_3 \parallel R_5} = \left( \frac{U_2}{R_1} - I_4 \right) \cdot \frac{R_7 \cdot R_1 \parallel R_3 \parallel R_5}{R_6 + R_7 + R_1 \parallel R_3 \parallel R_5}$$

For the internal resistance  $R_i$  the ideal voltage source is substituted by its resistance ( $=0\Omega$ , so a short-circuit):

$$R_{AB} = R_7 \parallel (R_6 + R_1 \parallel R_3 \parallel R_5)$$

with  $R_1 \parallel R_3 \parallel R_5 = 5\Omega \parallel 10\Omega \parallel 10\Omega = 5\Omega \parallel 5\Omega = 2.5\Omega$ :

$$U_{AB} = \frac{6.0\text{V}}{5.0\Omega} - 4.2\Omega \cdot \frac{15\Omega \cdot 2.5\Omega}{7.5\Omega + 15\Omega + 2.5\Omega}$$

$$R_{AB} = 15\Omega \parallel (7.5\Omega + 2.5\Omega)$$

These is the full exam

Full exam

### Exercise E1 Resistance of a Wire by Resistivity (written test, approx. 6 % of a 60-minute written test, WS2022)

The heating element made of nichrome wire with a cross-section of  $1.80\text{ mm}^2$ . Each second, a power dissipation (= heat flow) of  $P=40\text{ W}$  is necessary. Determine the current  $I$  needed to operate for heating elements. The Nichrome wire has a resistivity of  $1.10 \cdot 10^{-6}\Omega\text{ m}$ . The heating element is  $3\text{ m}$  long and has a diameter of  $3.57\text{ mm}$ . Calculate the resistance  $R$  of the heating element.

Solution

$$P = U \cdot I = R \cdot I^2 \quad \rightarrow \quad I = \sqrt{\frac{P}{R}} = \sqrt{\frac{40\text{ W}}{0.33\Omega}}$$

$$R = \rho \cdot \frac{l}{A} \quad | \quad A = r^2 \cdot \pi = \frac{1}{4} d^2 \cdot \pi \quad \rightarrow \quad R = \rho \cdot \frac{4 \cdot l}{d^2 \cdot \pi} = 1.10 \cdot 10^{-6}\Omega\text{ m} \cdot \frac{4 \cdot 3\text{ m}}{(3.57\text{ mm})^2 \cdot \pi}$$

$$3 \cdot 10^{-3} \cdot \pi \cdot R^2$$

**Exercise E3 Temperature-dependent Resistance**  
**(written test, approx. 6 % of a 60-minute written test, WS2022)**

A refrigerator is explained with the effect of temperature on the resistance of a resistor. The resistance of a resistor is given by  $R = R_0 (1 + \alpha \Delta T + \beta \Delta T^2)$  for  $\Delta T$  in  $^{\circ}\text{C}$ . Its temperature coefficients are:  $\alpha = 0.01 \text{ K}^{-1}$  and  $\beta = 71 \cdot 10^{-6} \text{ K}^{-2}$ .

The temperature inside the refrigeration system can reach down to  $-40^{\circ}\text{C}$ .

Result  
 Calculate the resistance of the thermistor at  $-40^{\circ}\text{C}$ .

The power transferred to the resistor is  $P = U^2 / R$ . The heat generated is  $Q = P \cdot t$ . The heat flow might heat up the refrigeration system. Therefore, with constant  $U$  and increasing  $R$  the power decreases. Ten times more resistance decreases the heat flow to one-tenth.

$$R = R_0 (1 + \alpha \Delta T + \beta \Delta T^2)$$

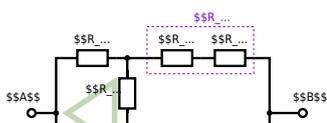

$$R = 10 \cdot (1 + 0.01 \cdot (-40 - 25) + 71 \cdot 10^{-6} \cdot (-40 - 25)^2)$$

**Exercise E2 Equivalent linear Source  
(written test, approx. 14 % of a 60-minute written test, WS2022)**

The circuit in the following has to be simplified.  
Result

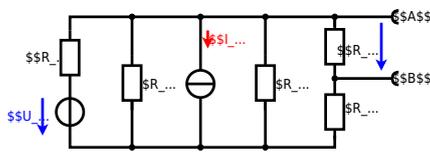

$$U_{\text{S}} = U_{\text{AB}} = 4.5 \, \text{V} \parallel R_{\text{i}} = R_{\text{AB}} = 6 \, \Omega$$

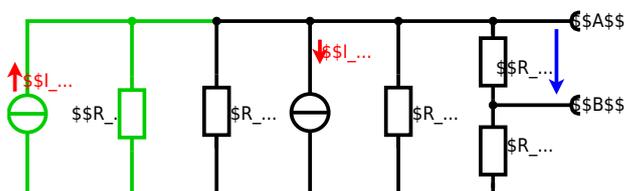

Calculated the internal resistance  $R_{\text{int}}$  and the source voltage  $U_{\text{source}}$  of an equivalent linear voltage source on the connectors  $\text{A}$  and  $\text{B}$ .  $\begin{aligned} R_1 &= 5.0 \text{ } \Omega, & U_2 &= 6.0 \text{ V}, & R_3 &= 10 \text{ } \Omega, & I_4 &= 4.2 \text{ A}, \\ R_5 &= 10 \text{ } \Omega, & R_6 &= 7.5 \text{ } \Omega, & R_7 &= 15 \text{ } \Omega \end{aligned}$   
 Use equivalent sources in order to simplify the circuit!

Solution

The best thing is to re-think the wiring like rubber bands and adjust them:

The linear voltage source of  $U_2$  and  $R_1$  can be transformed into a current source  $I_2 = \frac{U_2}{R_1}$  and  $R_1$ :

Now a lot of them can be combined. The resistors  $R_1$ ,  $R_3$ ,  $R_5$  are in

parallel, like also  $I_2$  and  $I_4$ : 
$$R_{135} = R_1 || R_3 || R_5$$
 
$$I_{24} = I_2 - I_4 = \left( \frac{U_2}{R_1} - I_4 \right)$$
 The resulting circuit can again be transformed:

Here, the  $U_{24}$  is calculated by  $I_{24}$  as the following: 
$$U_{24} = R_{135} \cdot I_{24} = \left( \frac{U_2}{R_1} - I_4 \right) \cdot R_1 || R_3 || R_5$$

On the right side of the last circuit, there is a voltage divider given by  $R_{135}$ ,  $R_6$ , and  $R_7$ .

Therefore the voltage between  $A$  and  $B$  is given as: 
$$U_{\text{AB}} = U_{24} \cdot \left( \frac{R_7}{R_6 + R_7 + R_1 || R_3 || R_5} \right) = \left( \frac{U_2}{R_1} - I_4 \right) \cdot \left( \frac{R_7 \cdot R_1 || R_3 || R_5}{R_6 + R_7 + R_1 || R_3 || R_5} \right)$$

For the internal resistance  $R_i$  the ideal voltage source is substituted by its resistance ( $=0 \Omega$ , so a short-circuit): 
$$R_{\text{AB}} = R_7 || (R_6 + R_1 || R_3 || R_5)$$

with  $R_1 || R_3 || R_5 = 5 \Omega || 10 \Omega || 10 \Omega = 5 \Omega || 5 \Omega = 2.5 \Omega$ :

$$U_{\text{AB}} = \left( \frac{6.0 \text{ V}}{5.0 \Omega} - 4.2 \Omega \right) \cdot \left( \frac{15 \Omega \cdot 2.5 \Omega}{7.5 \Omega + 15 \Omega + 2.5 \Omega} \right) || R_{\text{AB}} = 15 \Omega || (7.5 \Omega + 2.5 \Omega)$$

 dc network analysis, pure resistor network simplification, delta wye transformation, exam ee1 ws2022

### Exercise E1 Charging Capacitors (written test, approx. 16 % of a 60-minute written test, WS2022)

The capacitor becomes fully charged) dissipation of power in the circuit is again 0 W. The voltage across the capacitor is again 0 V at the moment  $t_0=0$  s when the switch  $S_1$  is closed. Calculate the voltage  $u_c(t_2)$  across the capacitor at  $t_2=1$  ms after closing the switch.

Hint: To solve this, first create an equivalent linear voltage source from  $U$ ,  $R_1$ , and  $R_B$ .

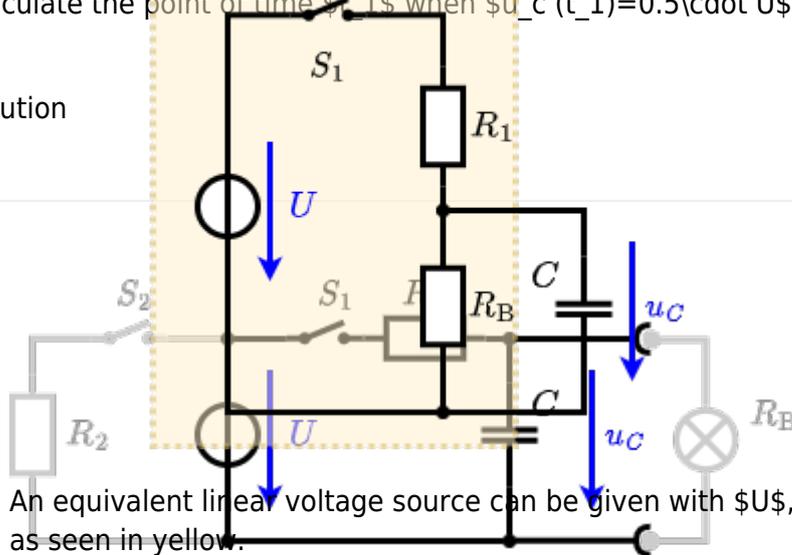

The internal voltage of the equivalent source is  $U_{eq} = U \cdot \frac{R_B}{R_1 + R_B}$  and the internal resistance is  $R_{eq} = R_1 \parallel R_B = \frac{R_1 \cdot R_B}{R_1 + R_B}$ . The voltage across the capacitor is  $u_c(t) = U_{eq} \cdot (1 - e^{-t/\tau})$  where  $\tau = R_{eq} \cdot C$ .  
 Solution:  $U_{eq} = \frac{12 \text{ V} \cdot 12 \text{ } \Omega}{12 \text{ } \Omega + 12 \text{ } \Omega} = 6 \text{ V}$   
 $R_{eq} = \frac{12 \text{ } \Omega \cdot 12 \text{ } \Omega}{12 \text{ } \Omega + 12 \text{ } \Omega} = 6 \text{ } \Omega$   
 $\tau = 6 \text{ } \Omega \cdot 100 \text{ } \mu\text{F} = 0.6 \text{ ms}$   
 $u_c(1 \text{ ms}) = 6 \text{ V} \cdot (1 - e^{-1 \text{ ms} / 0.6 \text{ ms}}) \approx 4.5 \text{ V}$   
 On an alternative view, one can try to create an equivalent linear voltage source again. Then, the internal resistance is given by substituting the ideal voltage source is again short-circuiting  $R_2$ .

The circuit contains a voltage source  $U=12$  V, a switch  $S_1$ , a resistor of  $R_1=20$   $\Omega$  and a capacitor of  $C=100$   $\mu\text{F}$ . The switch  $S_2$  to an additional consumer  $R_2$  will be considered to be open for the first tasks. At the moment  $t_0=0$  s the switch  $S_1$  is closed, the voltage across the capacitor is  $u_c(t_0)=0$  V.

... First do not consider the light bulb - it is not connected to the RC circuit. Calculate the point of time  $t_1$  when  $u_c(t_1)=0.5 \cdot U$ .

Solution

An equivalent linear voltage source can be given with  $U$ ,  $R_1$ , and  $R_B$  as seen in yellow.

Therefore, the voltage of the equivalent source is  $U_{eq} = U \cdot \frac{R_B}{R_1 + R_B} = 1/2 \cdot U$ . The internal resistance is given by  $R_{eq} = R_1 \parallel R_B = 6 \text{ } \Omega$ . The following formula describes the time course of  $u_c(t)$  which has to be  $u_c(t) = U_{eq} \cdot (1 - e^{-t/\tau})$  with  $\tau = R_{eq} \cdot C = 0.6 \text{ ms}$ . It has to be rearranged to  $(1 - e^{-t/\tau}) = 0.5$   $\Rightarrow e^{-t/\tau} = 0.5$   $\Rightarrow -t/\tau = \ln(0.5)$   $\Rightarrow t = -\tau \cdot \ln(0.5) = 0.6 \text{ ms} \cdot \ln(2) \approx 0.42 \text{ ms}$ .

**(written test, approx. 18 % of a 60-minute written test, WS2022)**

2. A series circuit contains a resistor with  $R = 100 \Omega$  and a capacitor with  $C = 40 \text{ nF}$ . The voltage source is  $v(t) = 160 \sin(2\pi \cdot 4 \cdot 10^6 t) \text{ V}$ .  
 Result:  $I = 1.00 \text{ A}$  and  $V_C = 160 \text{ V}$ .  
 A resistor  $R_1$  shall have the same absolute value of the impedance as a capacitor  $C_1 = 40 \text{ nF}$  at  $f = 4 \text{ MHz}$ .

Solution

$$R_1 = 100 \Omega$$

$$R_2 = 10.0 \Omega$$

A series circuit means that the current is constant on every component.  
 The equivalent impedance for  $R$  and  $C$  combined is given by  $Z = R - jX_C$   

$$Z = R - j \frac{1}{\omega C} = 100 - j \frac{1}{2\pi \cdot 4 \cdot 10^6 \cdot 40 \cdot 10^{-9}} = 100 - j1.59 \Omega$$
  
 The magnitude of the impedance is  $|Z| = \sqrt{R^2 + X_C^2} = \sqrt{100^2 + 1.59^2} \approx 100 \Omega$   
 A resistor  $R_1$  shall have the same absolute value of the impedance as a capacitor  $C_1 = 40 \text{ nF}$  at  $f = 4 \text{ MHz}$ .  

$$|Z_{R_1}| = |Z_{C_1}| \Rightarrow R_1 = \frac{1}{\omega C_1} = \frac{1}{2\pi \cdot 4 \cdot 10^6 \cdot 40 \cdot 10^{-9}} = 100 \Omega$$
  
 Therefore, the resulting current of the parallel circuit is given as:  

$$I = I_R + I_C$$
  

$$I = \frac{V}{R} + \frac{V}{X_C} = \frac{160}{100} + \frac{160}{1.59} = 1.6 + 100.6 = 102.2 \text{ A}$$
  
 This current is the sum of the currents through the resistor and the capacitor.  
 The voltage across the resistor is  $V_R = I \cdot R = 102.2 \cdot 100 = 10220 \text{ V}$   
 The voltage across the capacitor is  $V_C = I \cdot X_C = 102.2 \cdot 1.59 = 162.5 \text{ V}$   
 The total voltage is  $V = \sqrt{V_R^2 + V_C^2} = \sqrt{10220^2 + 162.5^2} \approx 10220 \text{ V}$   
 The total current is  $I = \frac{V}{Z} = \frac{160}{100} = 1.6 \text{ A}$   
 The voltage across the resistor is  $V_R = I \cdot R = 1.6 \cdot 100 = 160 \text{ V}$   
 The voltage across the capacitor is  $V_C = I \cdot X_C = 1.6 \cdot 1.59 = 2.54 \text{ V}$   
 The total voltage is  $V = \sqrt{V_R^2 + V_C^2} = \sqrt{160^2 + 2.54^2} \approx 160 \text{ V}$   
 The total current is  $I = \frac{V}{Z} = \frac{160}{100} = 1.6 \text{ A}$   
 The voltage across the resistor is  $V_R = I \cdot R = 1.6 \cdot 100 = 160 \text{ V}$   
 The voltage across the capacitor is  $V_C = I \cdot X_C = 1.6 \cdot 1.59 = 2.54 \text{ V}$   
 The total voltage is  $V = \sqrt{V_R^2 + V_C^2} = \sqrt{160^2 + 2.54^2} \approx 160 \text{ V}$   
 The total current is  $I = \frac{V}{Z} = \frac{160}{100} = 1.6 \text{ A}$

**Exercise E1 Complex Impedance Circuit**

**(written test, approx. 15 % of a 60-minute written test, WS2022)**

1. Consider the circuit below. The voltage source is  $v(t) = 3.0 \sin(2\pi \cdot 15 \text{ kHz} \cdot t) \text{ V}$ . The resistor has a resistance of  $R = 10 \Omega$ . The inductor has an inductance of  $L = 30 \mu\text{H}$  and the capacitor has a capacitance of  $C = 0.22 \mu\text{F}$ .  
 Result:  $I = 19.8 \text{ mA}$  and  $V_C = 48.2 \text{ V}$ .

Solution

Result

$$I = 19.8 \text{ mA}$$

$$V_C = 48.2 \text{ V}$$

The total impedance is  $Z = R + jX_L - jX_C$   

$$Z = 10 + j\omega L - j\frac{1}{\omega C} = 10 + j2\pi \cdot 15 \cdot 10^3 \cdot 30 \cdot 10^{-6} - j\frac{1}{2\pi \cdot 15 \cdot 10^3 \cdot 0.22 \cdot 10^{-6}} = 10 + j2826 - j764 = 10 + j2062 \Omega$$
  
 The magnitude of the impedance is  $|Z| = \sqrt{R^2 + X^2} = \sqrt{10^2 + 2062^2} \approx 2062 \Omega$   
 The current is  $I = \frac{V}{|Z|} = \frac{3.0}{2062} = 1.45 \text{ mA}$   
 The voltage across the capacitor is  $V_C = I \cdot X_C = 1.45 \cdot 764 = 1.11 \text{ V}$   
 The voltage across the inductor is  $V_L = I \cdot X_L = 1.45 \cdot 2826 = 4.09 \text{ V}$   
 The voltage across the resistor is  $V_R = I \cdot R = 1.45 \cdot 10 = 14.5 \text{ V}$   
 The total voltage is  $V = \sqrt{V_R^2 + V_L^2 + V_C^2} = \sqrt{14.5^2 + 4.09^2 + 1.11^2} \approx 15.5 \text{ V}$   
 The total current is  $I = \frac{V}{|Z|} = \frac{15.5}{2062} = 7.5 \text{ mA}$

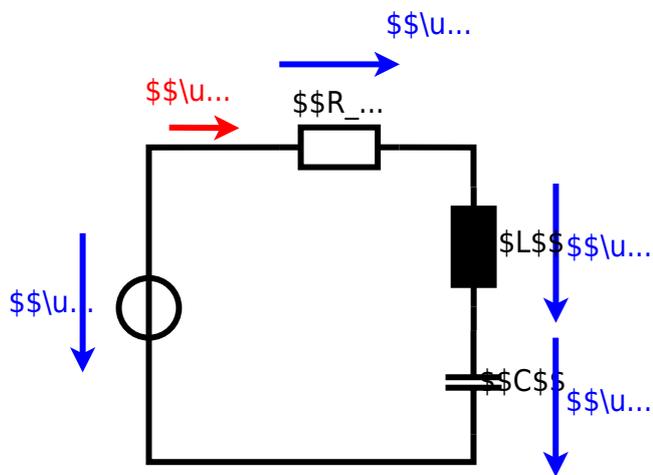

```

\begin{align*} Z_C &= \frac{1}{2\pi \cdot f \cdot C} \quad \&= \frac{1}{2\pi \cdot 15 \cdot 10^3 \cdot 330 \cdot 10^{-6}} \\ \underline{Z} &= R + \underline{Z}_L + \underline{Z}_C \quad \&= R + j \cdot \underline{Z}_L - j \cdot \underline{Z}_C \\ \underline{Z} &= R + j \cdot (\underline{Z}_L - \underline{Z}_C) \quad \&= \sqrt{R^2 + (\underline{Z}_L - \underline{Z}_C)^2}
\end{align*}

```
