Voltage divider as voltage source 2

Voltage divider as voltage source

The voltage divider shown in [figure 1](#) is in an unloaded state, as the entire current supplied by the power supply flows through the resistors R_1 and R_2 connected in series. A resistor parallel to R_2 loads the voltage divider. Set the voltage on the power supply to 12 V and measure the exact voltage with a multimeter. Set up the measuring circuit shown in [figure 1](#). For the connected load $R_L = 10 \text{ k}\Omega$, the voltage divider represents a voltage source. Like any voltage source, it has a source voltage (also called the original voltage) U_0 and an internal resistance R_i . The internal resistance of a voltage divider considered as a voltage source results from the parallel connection of the divider resistors R_1 and R_2 :

$$R_i = R_1 || R_2 = \frac{R_1 \cdot R_2}{R_1 + R_2}$$

Use the measured values of resistors R_1 and R_2 to calculate the internal resistance R_i of the voltage source: $R_i = \dots$ $U_0 = \dots$

The power P_0 supplied by the power supply can be calculated using the following equation:

$$P_0 = U \cdot I_1$$

The power consumed by the load resistance can be determined using the following formula: $P_L =$

Start drawing by
clicking here

$$R_L \cdot I_2^2$$

Draw the equivalent voltage source of the voltage divider:

Fig. 1: Voltage divider

What would be the value of U_2 without R_L ?

$U_{2,0} = \dots$ Calculate $U_{2,L}$ and I_2 for $R_L = 10 \text{ k}\Omega$ using the values of the equivalent voltage source: (Provide formulas!) $U_{2L} : \dots$ $I_2 : \dots$

Check the values by measuring:

$$U_{2L, \text{Meas}} : \dots$$

$I_{2, \text{Meas}} : \dots$ Check the values using Kirchhoff's rules: (Provide formulas!)

$$U_{2L} : \dots$$
 $I_2 : \dots$
